Version 9.1.278 (30 November 2026)

Data Warehouse

Resolved errors within DWHDeploy.yml (#159493)

Problem

- The yml file for DWHDeploy did not picked up to be run due to spaces and bug on script

Solution

- Removed spaces for "name: Run DWH Deployment Script" - Corrected default from vernon to Master - Removed = for step rundwhdeploymentscript

Created a new monitor script that will be used to track new DWH scripts (#157439)

New Functionality

- Created a new monitor script that will be used to track new DWH scripts

Renamed Procedure from spCreateTables to CreateTables (#158822)

New Functionality

- Renamed Procedure from spCreateTables to CreateTables

Created powershell script to deploy new DWH stored procedures (#159493)

Problem

- Step needs to be added to the DWH workflow to deploy new DWH stored procedures

Solution

- Created powershell script to deploy new DWH stored procedures - Updated DWH workflow to include new powershell script as step

Corrected the name structure for LearningManagementReport_ETL (#158822)

Problem

- The scripts uses sp for LearningManagementReport_ETL which needs to be changed

Solution

- Corrected the name structure for LearningManagementReport_ETL from sp to lm

Created spRefreshExecuteSequence that will be used for new DWH Process (#158822)

Problem

- RefreshExecuteSequence needs to be created for the new DWH process

Solution

- Created spRefreshExecuteSequence that will be used for new DWH Process - Created folder for Log scripts

Implemented performance improvements within rbListItemValue (#142737)

Problem

- The insert step ran slow on Live due to adding check to see if fields exists which is not needed since the records are removed

Solution

- Removed unused script - Updated Insert to not include check since the records are deleted within delete step within insert step for rbListItemValue

---

General

Retry GitHub-dependent workflow steps (#154841)

Problem

- Workflow runs fail when GitHub briefly rejects a push, release call or API request, even though the same run passes when attempted again.

Solution

- Retry the steps that only talk to GitHub, so a short outage no longer stops a build, deployment or release.

Retry GitHub release downloads during builds and deploys (#154841)

Problem

- Builds and deployments fail when a file download from GitHub times out.

Solution

- Retry the download before failing, and fall back to a direct download when the setup step cannot fetch it.

Run Basic Checks after QA and UAT deployments (#152188)

Problem

- BasicChecks are started manually after deploying services.

Solution

- Run BasicChecks after successful deployments to active non-Live environments and link the results in Signify Testing.
- Merge the companion Selenium fix first (https://github.com/Signify-Software/SignifyAutomatedTests/pull/27).

Imports

Extend custom import timeout (#156443)

Problem

- The default timeout on custom steps is 30s for clients with multiple steps that run more than this time it causes a fatal error in the import and it cannot continue

Solution

- Allow for an extended execution time during custom steps up until 10min before raising the fatal error

---

Job Profiler

Resolved check to exclude future appointments from end of service calculation (#158002)

Problem

- When a user appointment has an end date an end of service mail is send to line manager accordingly to settings - but if it is a user that has changed positions to a new future appointment it is still being calculated

Solution

- Added exclusion to where clause that if the user has a future appointment date

---

Master Data

Resolve master data duplication issues (#157890)

Problem

- There are instances where master data records can be added in duplicate. A previous implementation was made but this was not generic enough and did not work for all master data entities.

Solution

- Revert previous changes, minor change to current master data interceptor, add missing unique keys to master data tables where appropriate.

People Management

Raise legacy integration threshold to 8.36 (#152371)

Problem

- The V8 AES enhancements is only valid from 8.36

Solution

- Default to version 8.36 and raise the minimum version for ruleset integration, security-key authentication, and legacy SSO. Update the SSO tests accordingly.

Correct reinstatement of a user into a non vacant or inactive position. (#159263)

Problem

- When resinstating a person into their previous position that was made inactive the previous position does not become active again. It is possible to reinstate a person into a position that is not vacant The users name and surname does not display on the reinstatement modal

Solution

- During reinstatement also set the position as active Show overlap message when reinstating and the position is not vacant, correct reinstatement check when the

restatement end date is open ended Add the name and surname from the row for display

---

Ruleset Management

Pass the ruleset default culture to V8 schema setup (#156394)

Problem

- The default language chosen for a ruleset was not sent when setting up a new or copied site, leaving new sites in English (US).

Solution

- Send the ruleset's default language when setting up the linked site automatically or manually, using fresh ruleset details.

Inherit the default ruleset language (#159267)

Problem

- New rulesets showed the system language even when Ruleset 1 used a different default.

Solution

- Preselect Ruleset 1's language and publish it when the new ruleset is saved.
