

# Version 9.1.144.1 (Support Release - 13 February 2025)

## Translations

Themes translation not showing on Login (#126618)

### Problem

- The translations on the login page are not working

### Solution

- Ensure the translations pull through to the login page

---

## Ruleset Management

Able to log into a deactivated ruleset (#126304)

### Problem

- The user could not log in immediately after a ruleset was activated / User could log in after a ruleset was de-activated.

### Solution

- Bust the cache when activating/deactivating the ruleset
-

# People Management

## Error when a user tries to reset their password (#126175)

### Problem

- When the user tries to reset their password the attempt fails because the call is checking whether the user has the People Admin role. This should not be done when the user is resetting their password.

### Solution

- Changed the ResetPassword call to check whether the user has the People Admin role or is the user whose password is being reset and then allowed the action.
  - Also, change the message displayed when the user reset their password from "A notification has been sent to the Person to reset their password." to "A notification has been sent to you to reset your password."
- 

## Master Data

### Navigating to the requirements tab displays an error (#127019)

#### Problem

- Batched queries failed due to too many of the same foreign keys

#### Solution

- Updated query to use DapperExtension to reduce the number of parameters and remove batch query functionality

### Load indicator shown indefinitely when clicking on person's profile (#127605)

#### Problem

- DapperInBatched was misused in the translation query, causing an invalid SQL query to be generated.

## **Solution**

- Ensure that DapperInBatched is used correctly for the query.

---

# **Notifications**

The user who registers does not receive their email (#126173)

## **Problem**

When a new user registers on the system using the Identity auto registration functionality:

1. The default appointment record did not get created leading to the user being seen as inactive due to not having an appointment.
2. The email confirmation email did not get sent out and the user could never continue with the registration

## **Solution**

- Ensure that when registering the default appointment gets created.
- Resolve the issue where the confirmation email was not getting sent out after the user registers.

---
