

Version 9.1.223 (13 April 2026)

Imports

Make grading types anonymous when running the Payspace connector on a schedule (#146311)

Problem

- When pulling grading types during the payspace import that runs on a schedule, an unauthenticated request is received

Solution

- This pull request introduces a minor change to the JobProfilerServiceV1 gRPC service by allowing anonymous access to the ListGradingTypes method.
 - This update makes the endpoint accessible without authentication.
-

Communication Portal

Recipient and Owner incorrectly displayed (#147067)

Problem

- The results being returned are sorted by unread messages. Still, a rule exists that an entry occurs only when the user first opens this, causing NULL values, and that, when sorting this, it takes priority over 1 unread message, for example.
- When a user creates a discussion with another user, the owner sees the recipient's name when opening the discussion, but the recipient sees their name as well, instead of the owner's name

Solution

- Corrected order clause to match the same as wproperty
- Added a check to correctly retrieve the needed details depending on the owner-recipient.

Resolved the "save and add a new" issue (#147474)

Problem

- When a user opens a modal to add a new record, it gets the default values rendered for the colour picker and icon selection. Once they save and add a new one, the form gets cleared, but the default values are not initialised, causing an issue on save

Solution

- Add a correction to JavaScript to initialise the fields
-

Performance Management

Change popover display on contract to have all information combined into a single scrollable popover (#146587)

Problem

- Because of the new popover component and the fact that on a contract, there are multiple items that each have individual popovers, when you hover over each item quickly, it does not look great with all the popovers opening.

Solution

- Combined the popovers for all the L3 items into a single scrollable popover.
 - Additionally, added a toggle on the contract footer that allows the user to disable the popovers from showing.
-

Data Warehouse

Resolved error with Audit_ETLSSIS Package (#147404)

Problem

- The package failed for the Audit_ETLSSIS Package due to a staging table that is not being used anymore, which causes a SQL Syntax error
- AuditID field is missing within the V9 DWHPackage creation of audUserAccess

Solution

- Removed Join within Insert of #AuditResults as the Staging Table is not being used anymore
 - Added field AuditID within audUserAccess
-

Main Dashboard

Ensured the Kudos of large size can be read in the tooltip (#147381)

Problem

- When a large kudo message is sent, the entire message can not be read in the tooltip.

Solution

- Extended height and width params of SyncFusionPopover to SyncFusionPopoverWithEllipseText so the tooltip is scrollable.
 - Increase the size of the maxPopOverLength parameter to ensure the entire message can be read.
-

People Management

Updating conditional data to match the current business rule (#147175)

Problem

- When updating the Start Date in Group/ Start Date in Company to another date (e.g., 2023) and then updating the Current Position start date, the updated Start Date in Group / Start Date in Company resets to the date that it was before the initial update.

Solution

- Applying the current business rule, the Start Date in Group / Start Date in Company should only be reset to the oldest appointment start date in appointment history if it is unset or if it is a more recent date than the oldest appointment start date

Updating datatable hidden field handling (#146324)

Problem

- Tables are not correctly centred within the card, causing layout and alignment issues.

Solution

- Updated how table columns are hidden to align with standard DataTables behaviour.
 - This prevents hidden columns from affecting the layout and ensures the tables are properly centred
-
-
