

# Version 9.1.240 (6 July 2026)

## Imports

Add ExportData v2 and update the notice period for backwards compatibility (#151719)

### Problem

- The notice period field type change is not backwards-compatible in the API.

### Solution

- Introduce a new version (v2) of the Export Data gRPC API for job profiler appointment exports, while also making some adjustments to the v1 API and improving Swagger documentation handling
- The main focus is on enabling a more flexible and extensible export endpoint, with improved data typing and service registration

---

## Dashboards

Fixed rounding of buttons on dashboard widgets (#151957)

### Problem

- Straight corners of buttons do not match the rest of the widget

### Solution

- Rounded the buttons (only the outside edges if there are multiple buttons), added padding to the inside of the card to offset the buttons from the side
- Fixed sizing/spacing issues on widgets

---

## Performance Management

## Resolve bug where you cannot delete contract files (#151715)

### Problem

- Cannot delete a file added to the contract

### Solution

- Add missing parameter required to check user authorisation to delete file on contract

## Improve the load for large groups of people when moving contracts in bulk (#151617)

### Problem

- Large groups of people cannot be loaded when doing a bulk move.

### Solution

- Introduce significant enhancements to the contract movement functionality, mainly by adding pagination and enriching the user data returned by the relevant endpoints
- The changes affect the backend query, gRPC API, and web controller to support more efficient data retrieval and improved client-side display
- These changes collectively improve the scalability, efficiency, and usability of the contract movement feature

---

## Organisational Structure

### Fixing max position selection error text (#152026)

#### Problem

- Selecting a position after having 20 positions selected shows an error message as "default text"
- Additionally, you cannot unselect any position after 20 positions were selected

#### Solution

- Added the missing error text hidden field
  - Fixed unselecting logic
- 

## Data Warehouse

Updated ContentManagement to fetch file data for all active clients (#151058)

### Problem

- Currently, PowerShell is only fetching data for MultiV8

### Solution

- Updated PowerShell scripts to fetch for all Live Clients
- Made adjustments to the DWH steps for ContentManagement to cater for all the V8 Live clients

Updated the production ServerName for LearningManagementReport\_ETL (#142732)

### Problem

- The LearningManagementReport\_ETL did not refresh due to the production server name that changed

### Solution

- Updated the production ServerName for LearningManagementReport\_ETL
- 

## Content Management

Fix file upload bugs (#151789, #151794)

*Issue 1*

### Problem

- No warning when max file size is exceeded in chat

### **Solution**

- Ensure warning message is displayed for file upload size exceeded.
- Also, the exception handling middleware did not correctly return AJAX errors when the fetch API was used, causing the request to fail silently.

### *Issue 2*

### **Problem**

- "Default" helper text not showing after removing the input from the field

### **Solution**

- Ensure default text always displays even when the value is filled in

---

## **People Management**

Trim username on update of summary and profile tab (#149383)

### **Problem**

- Updates on the summary and profile tab do not trim username

### **Solution**

- Trim username on update of summary and profile tab

---

## **Communication Portal**

Resolved styling, file selection, and Job Position Audience count (#141183)

## Problem

- Still had old JavaScript references on input events for create/edit template; same issue with the file selection and SaveAddNew; incorrect file count returned when identified on multiple audiences; incorrect style on invalid line items
- No placeholder on dropdown for select option

## Solution

- Removed and ensured the new shared JS editor handles it correctly
  - Correct query logic to count on deduplicated records if identified more than once
  - Correct styling
  - Added placeholder
- 

## Report Builder

### Fixed "User Validation Reports" not exporting correctly (#151687)

#### Problem

- Report exports and user import validation exports could fail due to mismatched data/service lifetimes

#### Solution

- Add a DataTable-based report result path for ReportBuilder exports. Update the background user validation export to create its own DI scope
  - Remove the unused #Usernames temp table drop and clean up the OpenXML comment formatting
- 

## Learning Management

### Fix marksheet mark override link to training intervention (#151708)

#### Problems

- Marks linked to the wrong source on first save. When a user captured a brand-new mark in a highlighted (yellow) cell and saved, the mark stayed \*\*linked to the training

intervention\*\* on the first save and only "delinked" on a second save, even though it had been entered manually

- Manual overrides could be reverted
- A manually overridden mark could be unexpectedly changed back to the learner's original training-record score

## Solution

- A manually entered mark now \*\*delinks on the first save\*\* - no second save needed
  - A manual override now \*\*stays in place\*\* unless the learner record itself was genuinely edited more recently, in which case the mark re-syncs to the learner record (most-recent change wins). This uses the learner-record last-edited date now supplied by V8
