

Version 9.1.248 (17 August 2026)

Notifications

Update materialised birthday column to Alias 'Birthday', else query can't find the column (#153450)

Problem

- Manager Birthdays and Work Anniversaries email template not firing on scheduled jobs

Solution

- Update the materialised birthday column to Alias 'Birthday', else query can't find the column

Implement end-of-service warning notifications for month and day period warnings (#138602)

Problem

- The Line Manager is not warned on user is ending their service soon

Solution

- Introduced new functionality to support manager notifications about subordinates' upcoming end of service, both for short-term (days) and longer-term (months) periods.
- It adds new event and recipient codes, extends the data model and queries, and updates the notification service to deliver these new types of notifications.
- Additionally, it introduces a bi-weekly schedule type and improves code structure by refactoring repeated logic.

Performance Management

Fixing mdb script reference (#153492)

Problem

- Models do not open because the MDB script reference is incorrect.

Solution

- Fixed the MDB script reference. Modals open as expected again.

Resolved issue where Overall Final Score label mappings were not showing (#153405)

Problem

- Score label mappings for Overall Final Score were not showing

Solution

- Fixed condition check that determines whether to display for overall final score

Job Management

Insert missing UserCompanyDates records during user import (#146950)

Problem

- `ImportUserDatesAsync` (used by the JobProfiler user import) only ever `UPDATE`d existing `JobProfiler.UserCompanyDates` rows. Since the materialisation rework, `UserCompanyDates` is no longer created as part of the User aggregate, so newly imported users never got a `UserCompanyDates` row created for them — their start dates

were silently dropped.

Solution

- Added an ``INSERT INTO JobProfiler.UserCompanyDates`` step (before the existing ``UPDATE``) that creates a row for any imported user matched by username who doesn't already have one for that ruleset, using the same create-vs-update semantics as ``UserDomainService.UpdateUserCompanyDatesIfRequiredAsync``.
- Replaced the row-by-row string-concatenated ``INSERT`` loop used to populate the ``#UserDates`` temp table with a ``SqlBulkCopy``, matching the pattern already used elsewhere in ``UserQueries.cs`` (e.g. ``ListUserOrgPathsAsync``). This also removes the manual string escaping that was needed for the old concatenation approach.

Communication Portal

Resolved archived items not shown when collapsed (#151781)

Problem

- Archived items can not be seen when the system alert has elapsed

Solution

- Add a change to the query that, when searching archived, ignores the dates of the system alert to be shown

Resolved flatpickr that caused errors on communication portal banners (#153083)

Problem

- flatpickr injects a hidden `type="number"` minute input with `step="5"`. If the banner datetime has a minute like 17, browser validation marks that hidden control invalid and blocks submission before the AJAX save handler runs.

Solution

- Set minuteIncrement: 1, so all valid minute values 0-59 pass native validation
-

Data Warehouse

Added ID fields within ImEvent tables (#151434)

Problem

- Field EventStatusID needs to be added within ImEventSchedules
- Field AttendanceStateID needs to be added within ImEventScheduleSessions
- Field BookingStatusID needs to be added within ImEventScheduleAttendees

Solution

- Added the field EventStatusID within ImEventSchedules
- Added field AttendanceStateID within ImEventScheduleSessions
- Added field BookingStatusID within ImEventScheduleAttendees

Updated Insert step for ImEventScheduleSessions_Staging_V9 (#153307)

Problem

- Duplicate results are returned
- The #Source is not needed in Insert ImEventScheduleSessions_Staging_V9

Solution

- Added DISTINCT and removed #Source within Insert ImEventScheduleSessions_Staging_V9
-

Revision #1
