

Version 9.1.250.2 (Support Release - 25 August 2026)

Imports

Import Sage profile images (#148015)

New functionality:

- This change adds a PowerShell process that imports employee profile photos from Sage into Signify.
- It can run automatically every day through Windows Task Scheduler.
- Developers can also run it manually to preview which employees and photos will be processed before starting an import.
 - Retrieves employee photos from Sage.
 - Filters the results by the configured company and company rule.
 - Selects the latest photo for each employee.
 - Safely ignores identical duplicate Sage records.
 - Stops when duplicate records contain conflicting photos.
 - Uploads photos to Signify in small batches.
 - Records successes and failures in timestamped log files.
 - Returns a failure exit code when a scheduled import does not complete successfully.

Correction to import of custom fields (#154641)

Problem

- Import fails when new users and existing users are imported that have custom fields

Solution

- This change makes improvements to the `ImportUsersCommandHandler` in the Account service, focusing on better error reporting and ensuring proper entity detachment during user import operations.

Revision #1
