

Version 9.1.265 (20 October 2026)

Communication Portal

Resolved grpcCache (#156428)

Problem

- Missing vary by user for alerts

Solution

- Added vary by user

UI change on system alert card (#156337)

Problem

- Request to change the Card and move buttons to the header

Solution

- Add UI change to move to the card header

Dashboards

Resolved grpcCache on widgets (#156603)

Problem

- Methods not busted on query data

Solution

- Added bustable methods to clear cache
-

Data Warehouse

Fixed Event Scheduling Course Name (#156860)

Problem

- Course Name was incorrectly populated with the Course Type value instead of the actual Course Name.

Solution

- Updated the source mapping to use `TrainingInterventions.Description`, falling back to `EventSchedules.CourseDetail` when unavailable. Also updated the incremental filter to capture Training Intervention changes.

Removed unused steps within CreateTables SSIS Package (#156923)

Problem

- Unused steps are still available within CreateTables SSIS Package steps

Solution

- Removed unused steps within acc tables
- Removed unused steps within jp tables
- Removed unused steps within pdm tables
- Removed unused steps within lm tables
- Removed unused steps within comu tables

HR Processes|V9-Ruleset Management

Add custom spritesheet support for landbot bubble (#156958)

Problem

- All clients have the same generic landbot bubble icon.

Solution

- Allow clients to upload a spritesheet to have custom and dynamic landbot bubbles and add custom icon and bot name functionality.

Display escalated on cards if the request was escalated. (#156779)

Problem

- Approval level shows as 'Approved' when the user has escalated a request

Solution

- Display escalated on cards if the request was escalated instead of approver

Identity and Authorisation

Fixed 405 error after logging in with an emailed or SMS one-time pin (#157262)

Problem

- After entering the one-time pin sent by email or SMS, users saw an error page instead of being logged in.

Solution

- Logging in with an emailed or SMS one-time pin works again, and a pin that has been used still cannot be used a second time. 24 minutes ago

Validate alerts and sanitise notification popups (#156614)

Problem

- System-alert writes did not enforce their input contracts, and notification popups forwarded unsafe HTML.

Solution

- Validate alert fields, schedules and enabled-channel content before upload or persistence, preserving incomplete drafts and supported placeholders. Validate CC/BCC literal addresses with comma and semicolon separators. Reject empty tables and media whose source is removed by sanitisation. Reuse the HTML sanitisation helper for stored rich content and popups. Popups use an explicit formatting/link allowlist that removes forms, controls, frames, event handlers and inline styles. Sanitise fully expanded system-message bodies before persistence, covering recipient creation, updates and direct notifications while preserving safe formatting and subjects. Reuse the recipient message object to avoid repeated sanitisation.

Job Profiler

Resolved grpcCache on appointment dates (#156841)

Problem

- Appointment history data return is not busted when dates are updated

Solution

- Added bustable methods

Master Data

Fix master data field name translations not applying (#156488)

Problem

- Translations entered for library field names on the Language screen did not show on the Master Data list headings or on the Add and Edit pop-up. - On the Language screen, opening a library field gave an error, and the translation pop-up for most fields stayed on "Loading...".

Solution

- Translated field names now show on the Master Data list headings and on the Add and Edit pop-up. The error shown when a duplicate master data item is added also works again. - The Language screen opens library fields without the error, and the translation pop-up loads for every field.
-

Org Structure

Resolved incorrect translation key used (#156972)

Problem

- Incorrect translation key used

Solution

- Added correct translation key

Resolved people modal selector not showing in front of backdrop (#156411)

Problem

- On the Add Person page, the manager picker was being loaded inside the Add Person modal itself. Because of that, the dark overlay could appear above the manager picker instead of behind it, making the picker visible but not clickable.

Solution

- I changed the manager picker so that, when it opens, it is moved out of the Add Person modal and placed at the main page level. That lets the layers stack correctly:
 - Add Person modal stays behind.
 - The overlay sits between the two modals.
 - The manager picker appears on top and can be used normally.

Resolved reporting lines being returned (#156972)

Problem

- A "User" user reporting line is being returned in that call being made instead of the actual reporting lines for the ruleset

Solution

- Added change to take a list of field sections for self-service settings and build reporting lines from that

People Management

Restore Additional Self Service Items in My Profile (#155020)

Problem

- The Additional Self Service Items option was removed from My Profile following a misunderstanding, preventing users from accessing it.

Solution

- Revert the removal and restore the option with its previous availability rules.

Performance Management

Fix new ruleset creation stuck on Performance Management setup (#157262)

Problem

- Creating a new ruleset never finishes. It stays on "Creating Ruleset" while Performance Management and Notification Confirmation wait to be set up.

Solution

- Copy the KPI edit and rating lock settings correctly, so the Performance Management setup copies across and the ruleset completes.
-

Report Builder

Resolve grpcCache bust (#157266)

Problem

- Bustable methods not defined for query methods

Solution

- Added bustable methods
-

Ruleset Management

Resolved virtual tour reset does not show again (#156946)

Problem

- When Reset do not show is clicked, it throws virtual tour does not exist, as the default one of ruleset 1 is shown,

Solution

- Add a change to delete the entry within the correct ruleset, and if on ruleset 1, do a join to ensure it is only for the ruleset users

System Access

Allow V8 popups to keep window.opener on legacy iframe host pages (#157058)

Problem

- V8 selection popups (e.g. PathwaySelection) opened from the V8 iframe could not call back into the page because COOP same-origin set window.opener to null.

Solution

- Send COOP same-origin-allow-popups on /App/AdditionalService and /Account/People/Edit. All other pages still send same-origin.

Revision #2
