

Version 9.1.268 (9 November 2026)

Communication Portal

Resolved the gRPC cache on audience (#156433)

Problem

- gRPC cache-busting methods can not be busted by other services

Solution

- Removed the cache query attribute,

Resolved modal editor losing focus when interacting with WYSIWYG (#156449)

Problem

- Using formatting options in the system message editor moved focus to the first dropdown and scrolled the modal to the top, making it difficult to format text or change font size.

Solution

- Updated the modal to allow interaction with the editor's formatting menus without moving focus away. Users can now format their message while keeping the editor in view.

Performance Management

Resolved duplicate scrollbar on moderation when opening select (#156207)

Problem

- Select2 attaches the popup container to the page body and positions it beside the selected field; forcing that container to full-page width makes it extend beyond the right edge, which can introduce horizontal scrolling and trigger additional vertical overflow as the available space changes.

Solution

- Remove this broad width override and let Select2 size its containers—the shared Select2Component already sets the filter control to width: '100%' and Select2 calculates the dropdown width automatically.
