Version 9.1.275 (30 November 2026)

Communication Portal

AI Development user story 1, 7, 8 and 9 (#156978, #157475, #157476, #157477)

New Functionality

- AI Development user story 1, 7, 8 and 9

Added preview to upload for room chat creation (#158148)

- Added preview to upload for room chat creation

Problem

- No preview of avatar once uploaded, only name shown in uploaded

Solution

- added new preview on left from uploader

Resolved master data items being added without required fields filled in (#156635)

Problem

- Master data item can be added without all required fields filled in

Solution

- Added check to ensure all required attributes have data

Swap Category and Filter select around (#157995)

Solution

- Swap category and filter around to match mockup and capitalize C

Implemented count on active pill filters for system alerts (#157995)

Solution

- Implemented change to showcase the total count within the filters of all and read

Improve System Alert date validation and focus (#157479)

Problem

- When validating System Alert dates, an error message could be displayed without bringing the relevant field into view. This happened because validation targeted a hidden input instead of the visible date field. Additionally, errors where the **Display From** date was later than the **Display To** date were only shown as a notification and not directly on the form.

Solution

- Updated validation to scroll to and focus the visible date field when an error occurs. Also added form-level validation to ensure the **Display To** date is later than the **Display From** date, displaying the localized error message directly on the form and moving focus to the **Display To** field.

Dashboards

Update “Today’s Value” translations (#158424)

Problem

- The “Today’s Value” label had a missing apostrophe in English and used inconsistent wording across locales. The Amharic translation was also missing.

Solution

- Correct the English label, update the French (Canada) wording, and add the Amharic translation across the dashboard locale files.

Dashboards (Framework)

Fit V10 charts to embedded dashboard iframes (#153349)

Problem

- V10 charts opened from V8 dashboards used V9’s standalone page layout, so their content could exceed the iframe and require scrolling. In the nested iframe flow, the browser could also omit V9 authentication cookies and show the login page.

Solution

- Add an embedded chart mode that sizes charts to the iframe and resizes them when its viewport changes. Configure V9 authentication and antiforgery cookies for the embedded flow.

Data Warehouse

Implemented bug fixes within jpHRProcesses (#157424)

Problem

- - Not all the approval fields are populating for jpHRProcesses - The Status are not updating correctly for jpHRProcesses - All the files uploaded are not included within UploadedFileNames

Solution

- - Resolved issue where not all the approval details where populated within jpHRProcesses by returning records if it has been done by peoplegroup as well - Corrected the status check for jpHRProcesses - Added step to include all the files uploaded, not only the approved files

Added ROWHASH for pdm tables (#157164)

Problem

- - ROWHASH needs to be added for tables with alot of data

Solution

- - Added ROWHASH for pdmContracts - Added ROWHASH for pdmContractPeriods - Added ROWHASH for pdmContractPeriodActionPlans - Added ROWHASH for pdmContractPeriodSectionItems

Added ROWHASH for jp tables (#157164)

Problem

- - ROWHASH needs to be added for tables with alot of data

Solution

- - Added ROWHASH for jpReportingLines - Added ROWHASH for jpJobPositions - Added ROWHASH for jpJobProfiles - Added ROWHASH for jpSecondaryAppointments

Created stored procedure to monitor Data Warehouse Front-End Refresh Job Status (#157165)

New Functionality

- Created stored procedure to monitor Data Warehouse Front-End Refresh Job Status

Updated date fields to be selectable for accUserPermits (#157453)

Problem

- - The date fields for UserPermits are not selectable and searchable within ReportBuilder

Solution

- - Update date fields to be selectable for UserPermits

General

Included missing project references in project files and included persistent whitespace changes (#0)

Problem

- Missing projects in Dockerfile.

Solution

- Added missing project references in project file.

Follow up 158520 Ruleset Management Fix crash on the feature setup in progress page (#0)

Problem

- Admin users who open an additional service that is still being set up see the generic error page instead of the "Feature setup in progress" message.

Solution

- Show the setup message correctly for all users while the feature is being set up.

Update vulnerable .NET, SignalR Redis and MessagePack packages (#0)

Problem

- The Kubernetes build fails because `Microsoft.AspNetCore.SignalR.StackExchangeRedis` 10.0.13 has a high severity advisory (GHSA-wr8v-9x5q-ggcm), and `MessagePack` 3.1.8 and `System.Formats.Cbor` 9.0.0 have moderate ones.

Solution

- Move the .NET 10 packages and ASP.NET runtime images from 10.0.13 to 10.0.15, `MessagePack` to 3.1.9, and pin `System.Formats.Cbor` to 10.0.15, so all 70 projects restore with no vulnerable packages.

Update vulnerable web utilities package (#0)

Problem

- A vulnerable package stops the build during package restore.

Solution

- Update the package to a patched version.

Renew the Kyyte TLS certificates with a Kubernetes CronJob (#156700)

Problem

- The Kyyte website certificates expire every three months and are renewed by hand, so the sites show a security warning if a renewal is missed.

Solution

- Add a weekly Kubernetes CronJob that renews each certificate when it is close to expiry, checks the new one, and replaces the secret the gateway reads. Tested on a test cluster for every step except the Cloudflare challenge, which is only allowed from the production cluster.

Select branch rulesets by branch name in the toggle workflow (#157851)

Problem

- - The Toggle Branch Ruleset workflow asks for ruleset names or ids, which users have to look up and can mistype.

Solution

- - Replace that input with a branch name (default master); the script finds the rulesets whose include and exclude patterns cover that branch, and fails if none do.

Fix UTF-8 encoding for Client imports (#158084)

Problem

- Client batch imports containing accented characters can be rejected with HTTP 400 because Windows PowerShell 5.1 sends the JSON string without UTF-8 encoding. The import request now explicitly uses application/json; charset=utf-8 so those characters reach the API correctly.

Solution

- Set the import POST's ContentType parameter explicitly and remove its duplicate Content-Type header.

Add workflow to temporarily disable branch rulesets (#157851)

Problem

- Merging between master and feature branches is blocked by branch rules, and giving bypass rights grants more access than a merge needs.

Solution

- Add a `Toggle Branch Ruleset` workflow: an approved user disables a ruleset for up to 480 minutes (default 20), and it re-enables itself on a ten-minute self-hosted schedule, or sooner with the `enable` action. - Only users in `RULESET_TOGGLE_ALLOWED_USERS` can disable, the workflow runs from `master` only, and every change is logged to the run summary and Teams.

Save Client import logs immediately (#158084)

Problem

- Client import logs were held in memory until the script finished, and keyboard prompts could prevent unattended runs from saving them. Entries are now saved immediately so batch failures can be investigated even if the run does not finish.

Solution

- Remove both keyboard waits. - Append existing messages immediately to one UTF-8 log file in the script folder. - Include milliseconds and process ID in the filename to separate concurrent runs, and remove the final buffered rewrite. - Preserve import requests, batching and existing messages; surface log-write failures.

Identity and Authorisation

Persist the company entry cookies across browser restarts (#157907)

- **Problem**

- After a browser restart the company login link was forgotten, so opening the site showed an error instead of the company login page.

Solution

- Remember the company and theme chosen from the login link for 30 days, independent of how long a sign-in lasts.

Imports

Remove OrganizationRegion mapping when pushing data (#158134)

New Functionality

- Remove OrganizationRegion mapping when pushing data

Remove OrganizationRegion mapping when pushing data (#158134)

Problem

- When pushing the OrganizationRegion to Payspace from the nationality it must first exist on Payspace to be allowed. This field is not required New payrol connector fields are populated from previous values in the browser posing a security risk

Solution

- Remove the OrganizationRegion mapping Prevent auto completion on the pay roll connector modal

---

Master Data

Check for exact record duplicates when adding new master data items. (#157890)

Problem

- Cannot add MasterData at all

Solution

- Add fix that was removed with code review

Check for exact record duplicates when adding new master data items. (#157890)

Problem

- Currently it is possible to add duplicate master data records.

Solution

- Added change to check for any duplicate records with same name or title current master data list.

Notifications

Resolved styling space on headers (#158251)

Problem

- Some headings had padding

Solution

- Add class to remove padding

Change translation for generic wrapper usage (#157680)

Problem

- Not clear when adding wrapper that it needs to be provided on the Editor's code view

Solution

- Amend usage translation to indicate template wrapper needs to be provided in code view

---

Onboarding

Added padding to detail below card (#156001)

Solution

- Added spacing to the detail wording below card

Add missing translation (#153849)

Solution

- Add missing translation

People Management

When people group setting is set to off for profile image upload, a user can still upload (#156769)

Problem

- The logic check was either or with the image resource upload setting,

Solution

- Corrected logic, that if the rule is present it must supersede that of the image resources

Fix transgression dropdown scrolling and selection (#158200)

Problem

- In the disciplinary action modal, opening a Select2 dropdown could select an option on mouse release. Scrolling the open menu could also restore the page’s previous scroll position or continue scrolling the page at the menu’s edge. Allowed upload file types were displayed without spaces after commas.

Solution

- Open and close the dropdown on click, select options on click, and remove Select2’s scroll restoration for these controls while repositioning the menu as the modal scrolls. Contain scroll chaining at the menu’s boundaries and display upload file types with comma spacing.

Preserve transgression row click events after pagination (#158201)

Problem

- Editing a current or expired transgression worked on the first table page, but row clicks stopped working after changing pages because handlers were attached only to the initially rendered cells.

Solution

- Delegate the edit click handlers from each DataTable so rows on every page open the transgression edit modal.

Invalidate cached transgression lists after changes (#158193)

Problem

- The transgression list is cached, so creating, updating, or deleting a transgression could leave the displayed list stale. File changes could also leave the cached file counts out of date.

Solution

- Configure the list query cache to invalidate after transgression create, update, and delete operations, and after transgression file create and delete operations.

Performance Management

Corrected rating label still showing on new contracts where review survey excluded by default (#158223)

Problem

- When a new contract is created review survey can be excluded by default, but the label is not showing this, only when including and excluding the review survey and saving does it actually indicate this

Solution

- The summary now shows “Excluded” from the start. There’s no need to open the survey or save it again.

Resolved evaluators not being reselected on select person modal (#158314)

Problem

- Within the evaluations modal, when selecting people and then reopening the modal to select more people, the previous users selected are not selected

Solution

- Added change to reselect the users that are selected

Corrected excluded review items still showing not rated and in calculation with tool tip summary (#158223)

Problem

- When review period has been excluded, it is still calculated within the text indication of ({item} + {item}), and still shown as label not rated

Solution

- Added filter to only include included review items for calculation overview, and when excluded show translation and not the not yet rated

Fix historical Score graph shows as In Progress when a Review Survey score has been Excluded (#158426)

Problem

- Historical Score graph shows as In Progress when a Review Survey score has been Excluded

Solution

- Ensure excluded scores are not taken into account Co-authored-by: William

---

System Access

Update default position to job title after registering (#158442)

Problem

- When a user registers on a specific job profile the position title is learner

Solution

- Ensure the default position created for a job profile is always the job profile's title. Only when the job profile is also a default profile will the position title be learner

---
