Version 9.1.75 (25 March 2024)

Tenant Management

Order Tenants properly on the index page (#113436)

Problem:

- Could not order on date on the tenant index page, because it tried to order on an already formatted date
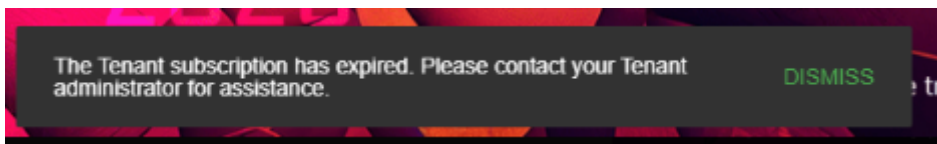

Solution:

- Made the order field to be a universal sortable date format. Also removed the order on the name of tenant. Used the SignifyDateHelper.

System Access

Tenant Expired message has been improved (#113535)

When a Tenant has reached the expiry date, the below message is now displayed:

People Management

Added correction to the People Management items when a user has no roles but all the needed people group permissions for the sections (#113486)

Problem:

- A user with no roles but all the people group permissions to edit the sections was not able to do the following without the people administrator role:
  - Terminate User
  - Transfer User
  - Reappoint User
  - Change the reporting lines
- A user without the job profiler administrator role is not able to add an appointment for a terminated user.
- A user without the job profiler administrator role can try and create a position on the appointment screen.
- An unauthorised is received after terminating a user today and trying to edit the user
- A user with only a People administrator role was able to manage role assignments under User Access

Solution:

- Remove the role check on the people administrator and replace it with a check on people group permissions
- Remove the check on the appointment screen that requires a user to be a job profiler administrator to appoint users
- Hide the button to create positions from the appointment screen when a user is not a job profiler administrator
- Change the date filter to include the current date when retrieving the active appointment of a user
- Change the People Administrator role to check the manage own access and logged-in user along with the role in the user access section.

Peformance Management

Fix not being able to submit final ratings when hide scores enable and perspectives are on (#113057)

Problem

- Cannot submit Final Ratings when Hide Scores setting is enabled

Solution

- Added logic on the final ratings submission to not calculate the perspective / KPA scores if hide scores is enabled, this was breaking because the weight is saved as 0% which caused divide by zero errors.

Added more detail to the import validation message (#112703)

Problem

- The validations message is not descriptive enough to a user when a Template Import fails where the KPA and KPI weights don't equal 100

Solution

- Improve the message
  - Template section weights should sum to 100%
